## TARTARIC STABILITY

### Tartarcheck - Tartaric Stability Instrumentation

Tartarcheck is an instrument for monitoring the tartaric stability in wine. It enables evaluation on how to further stabilise and improve the quality of the wine.

Tartarcheck works on the principle of accelerating the Potassium Hydrogen Tartrate (KHT) precipitation, by adding additional KHT in the form of fine crystals. The precipitation kinetics is followed by measuring the sample's electrical conductivity, which depends on the ions in solution (so not yet precipitated), in a thermostated chamber whose temperature follows a pre-set time profile by a microcomputer controlled Peltier heat pump.

The instrument is compact and self contained, with an LCD display and thermal printer, and can be connected to an external computer via RS232C. Also available with a touch screen LCD (Tartarcheck Plus).

#### Key Features

- Perform isotherm precipitation kinetics (at any temperature between -4 and 40 °C)
- Detect the tartaric stability (TS) by intersecting the thermal conductivity profiles both with and without KHT crystals
- Print and/or store (depending on the model) the precipitation kinetics for the isotherm test and the differential conductivity diagrams according to the temperature for the TS calculation.

## HYGIENE MONITORING – ATP METERS & SWABS

The novaLUM II ATP Detection System is a palm sized luminometer that offers excellent results for advanced sanitation control. It utilises a technologically advanced photomultiplier tube (PMT) that amplifies ATP (adenosine triphosphate) allowing detection of lower levels of microbial and organic contamination. This is a distinct advantage over systems that use less sensitive PMTs or photodiodes. The novaLUM II system's PMT has low noise, a greater dynamic range, a faster response time, and accuracy over a wider temperature range.

The novaLUM II system is easily customisable to your facility's needs. It has the ability to be programmed with the names of the specific tests you wish to perform, so you have a completely automated test plan. Different pass/ fail thresholds can be assigned to single test areas or to categories.

The novaLUM II system has enhanced onboard data analysis tools including the ability to search historical results and add corrective action results and to generate graphs for rapid analysis of Pass/Fail percentages for key areas of the plant. With built-in wireless connectivity these graphs can be emailed to key managers immediately after pre-op.

The novaLUM II system supports a variety of Charm ATP-based tests designed to strengthen hygiene monitoring programs and QA processes. These include the PocketSwab Plus swabs, FieldSwab, WaterGiene, and AllerGiene swabs.

### Designed for testing free or total sulfur dioxide (SO<sub>2</sub>) levels in wine.

Based on the Ripper Method, the IT0004 mini titrator uses an optimised pre-programmed method of analysis with a powerful algorithm that determines the completion of the titration reaction by the use of a specialised ORP electrode.

The IT0004 incorporates a precision piston style dosing pump that adjusts the volume of dosing dynamically based on the voltage change. This dosing system reduces the amount of time required for the titration while providing for a highly accurate determination of the amount of titrant used.

The IT0004 is supplied complete with all the materials necessary to perform low and high range measurement of SO<sub>2</sub>. All chemicals are premixed and prepackaged including standardised titrants, reagents and pump calibration.
